

git clone = means you can clone an already existing remote repository. The copy will be on your local computer.

git status = if you want to check the status for your working directory and staging area. It includes any modification, staged or untracked files.

git add = when you want to add changes to your staging area you use git add and specify which files you want to add. This stages the file you want to include in the next commit.

git commit = The staged changes you added before will now be saved as a snapshot in the history of your repository.

git push = You push your commits up to the the remote repo. Meaning after the push everyone that has access to your repo can access the changes and commits

git checkout = switches branches or restores files to a previous state
